

Patella Luxation Screening Form

Registered Name of Dog:

KC Registration: Microchip No.:

DoB: Gender: DOG/BITCH

Registered Owner's Name:

Address:

.....

Owner's Signature: Date of examination:

Veterinary Surgeon's Declaration

I confirm that the dog submitted for examination is the one described above.

The dog was over 12 months old at the time of the examination.

EXAMINATION RESULTS

Putnam score	Left:	Right:
Grade 0	Normal. The normal patella may have a mild degree of laxity but does not move outside of the trochlear ridges. The patella must be entirely out of the trochlear groove to be considered luxated.	
Grade 1	The patella luxates manually but spontaneously returns to the trochlea when released.	
Grade 2	The patella luxates spontaneously or on manipulation and remains luxated at a certain angle of the stifle joint. It is either spontaneously reduced on active flexion or extension or can be manually reduced by the examiner.	
Grade 3	The patella remains luxated most of the time but can be manually reduced. However, relaxation occurs spontaneously.	
Grade 4	The patella is permanently luxated and cannot be manually repositioned.
